## 0. Conventions

(1) An (algebraic) variety over a field $k$ is an integral seperated scheme of finite type over $k$.
(2) A subvariety of a variety is a closed subscheme which is a variety.
(3) A curve, surface or a threefold means a variety of dimension 1,2 or 3.
(4) A point on a scheme will always be a closed point.

## 1. Preliminaries

In this section, unless otherwise specified, $X$ always denotes a variety of dimension $n$ over an algebraically closed field $k$.

### 1.1. Torsion-freeness and relexivity.

### 1.1.1. Torsion-freeness.

Definition 1.1.1. An $\mathscr{O}_{X}$-module $\mathscr{F}$ is said to be locally free sheaf if there is an open covering $\left\{U_{i}\right\}$ of $X$ such that $\left.\mathscr{F}\right|_{U_{i}} \cong \mathscr{O}_{U_{i}}^{\oplus r}$ holds for every $U_{i}$.

Definition 1.1.2. An $\mathscr{O}_{X}$-module $\mathscr{F}$ is said to be coherent sheaf if
(1) $\mathscr{F}$ is of finite type.
(2) For every open subset $U \subseteq X$ and every morphism $\alpha: \mathscr{O}_{U}^{r} \rightarrow \mathscr{F}_{U}$, the kernel of $\alpha$ is of finite type.
Definition 1.1.3. A coherent sheaf $\mathscr{F}$ on $X$ is torsion-free if a stalk $\mathscr{F}_{x}$ is a torsion-free $\mathscr{O}_{X, x}$-module for every $x \in X$.

Definition 1.1.4. A coherent subsheaf $\mathscr{F}$ of a torsion-free sheaf $\mathscr{E}$ is said to be saturated if the quotient $\mathscr{E} / \mathscr{F}$ is again torsion-free.

Proposition 1.1.1. Let $X, Y$ be two varieties and $f: X \rightarrow Y$ be a dominant morphism. Then for any torsion-free $\mathscr{O}_{X}$-module $\mathscr{F}$, the direct image $f_{*} \mathscr{F}$ is a torsion-free $\mathscr{O}_{Y}$-module.
Proof. See Proposition 8.4.5 in [GD71].
Proposition 1.1.2. Let $X$ be a normal variety. Then every torsion-free sheaf is locally free outside a set of codimension two.
Proof. See Proposition 5.1.7 in [Ish14].
Corollary 1.1.1. Every torsion-free sheaf on a smooth curve is locally free.

### 1.1.2. Reflexivity.

Definition 1.1.5. A coherent $\mathscr{O}_{X}$-module $\mathscr{F}$ is said to be reflexive if the canonical homomorphism $\mathscr{F} \rightarrow \mathscr{F}^{* *}$ is an isomorphism.

Proposition 1.1.3. Every locally free sheaf is reflexive, and every reflexive sheaf is torsion-free.

Proof. It follows from the definitions.
Proposition 1.1.4. The dual sheaf of any coherent sheaf is reflexive.
Proof. See Proposition 5.5.18 in [Kob87].

### 1.2. Chow ring.

### 1.2.1. Cycles.

Definition 1.2.1. A $k$-cycle on $X$ is a $\mathbb{Z}$-linear combination of irreducible subvarieties of dimension $k$.
Notation 1.2.1. The group of all $k$-cycles on $X$ is denoted by $Z_{k}(X)$.
Definition 1.2.2. A Weil divisor on $X$ is an ( $n-1$ )-cycle.
Definition 1.2.3. A Cartier divisor on $X$ is a global section of quotient sheaf $\mathscr{M}_{X}^{*} / \mathscr{O}_{X}^{*}$.
Definition 1.2.4. A $k$-cycle $\alpha$ on $X$ is defined to be rationally equivalent to zero if there are finitely many $(k+1)$-dimensional irreducible subvarieties $W_{i} \subseteq X$ and non-zero rational functions. $f_{i} \in \mathbb{C}\left(W_{i}\right)$ such that

$$
\alpha=\sum_{i}\left[\operatorname{div}_{W_{i}}\left(f_{i}\right)\right],
$$

where $\operatorname{div}_{W_{i}}\left(f_{i}\right)$ is the divisor of the rational functions ${ }^{1} f_{i}$ on $W_{i}$.
Definition 1.2.5. The group of $k$-cycles modulo rational equivalences is defined to be $A_{k}(X)$, which is said to be the $k$-th Chow group.

Example 1.2.1. $A_{n-1}(X)$ is the group of Weil divisors modulo linear equivalence.

Notation 1.2.2. The group of Cartier divisors modulo linear equivalence is denoted by $\operatorname{Pic}(X)$.

Remark 1.2.1. There is a group homomorphism from $\operatorname{Pic}(X)$ to $A_{n-1}(X)$. In general it's neither injective nor surjective, but it's injective when $X$ is normal and an isomorphism when $X$ is smooth.

Definition 1.2.6. The group of cycles of codimension $k$ modulo rational equivalence is defined to be $A^{k}(X):=A_{n-k}(X)$.
1.2.2. The intersection pairing.

Theorem 1.2.1. Let $X$ be a smooth variety. There is a unique intesection product $A^{r}(X) \times A^{s}(X) \rightarrow A^{r+s}(X)$ for each $r, s$ satisfying the axioms listed below
(1) The intersection pairing makes makes $A^{*}(X)$ into a commutative associated graded ring with identity. It's called the Chow ring of $X$.

[^0](2) For any morphism $f: X \rightarrow Y, f^{*}: A^{*}(Y) \rightarrow A^{*}(X)$ is a ring homomorphism. If $g: Y \rightarrow Z$ is another morphism, then $f^{*} \circ g^{*}=(g \circ f)^{*}$.
(3) If $f: X \rightarrow Y$ is a proper morphism, $f_{*}: A^{*}(X) \rightarrow A^{*}(Y)$ is a homomorphism of graded groups. If $g: Y \rightarrow Z$ is another proper morphism, then $g_{*} \circ f_{*}=(g \circ f)_{*}$.
(4) If $f: X \rightarrow Y$ is a proper morphism, $x \in A^{*}(X)$ and $y \in A^{*}(Y)$, then
$$
f_{*}\left(x \cdot f^{*} y\right)=f_{*}(x) \cdot y .
$$

This is said to be the projection formula.
(5) If $Y, Z$ are cycles on $X$, and if $\Delta: X \rightarrow X \times X$ is the diagonal morphism, then

$$
Y . Z=\Delta^{*}(Y \times Z) .
$$

(6) If $Y$ and $Z$ are subvarieties of $X$ which intersec properly (meaning that every irreducible component of $Y \cap Z$ has codimension equal to $\operatorname{codim} Y+\operatorname{codim} Z)$, then

$$
Y . Z=\sum i\left(Y, Z ; W_{j}\right) W_{j},
$$

where the sum runs over the irreducible components $W_{j}$ of $Y \cap Z$, and where the integer $i\left(Y, Z ; W_{j}\right)$ depends only on a neighborhood of the generic point of $W_{j}$ on $X$, which is said to be the local intersection multiplicity of $Y$ and $Z$ along $W_{j}$.
(7) If $Y$ is a subvariety of $X$, and $Z$ is an effective Cartier divisor meeting $Y$ properly, then $Y . Z$ is just the cycle associated to the Cartier divisor $Y \cap Z$ on $Y$, which is defined by restricting the local equation of $Z$ to $Y$.

Proof. See appendix A. 1 in [Har77].
Remark 1.2.2. If $X$ is not smooth, the intersection pairing also makes sense in some subtle setting. For example, for any variety (or scheme), there is always an intersection pairing

$$
\operatorname{Pic}(X) \times A^{k}(X) \rightarrow A^{k+1}(X) .
$$

### 1.3. Chern classes.

### 1.3.1. Chern classes of locally free sheaf.

Definition 1.3.1. A locally free sheaf $\mathscr{E}$ of rank $r$ on $X$ has Chern classes $c_{i}(\mathscr{E}) \in A^{i}(X)$ for all $0 \leq i \leq r$, which is defined by

$$
\sum_{i=0}^{r}(-1)^{i} \pi^{*} c_{i}(\mathscr{E}) \xi^{r-i}=0
$$

in $A^{r}(\mathbb{P}(\mathscr{E}))$, where $\xi \in A^{1}(\mathbb{P}(\mathscr{E}))$ be the class of the divisor corresponding to $\mathscr{O}_{\mathbb{P}(\mathscr{E})}(1)$ and $\pi: \mathbb{P}(\mathscr{E}) \rightarrow X$ be the projection.

Definition 1.3.2. Let $\mathscr{E}$ be a locally free sheaf of rank $r$ on $X$. The total Chern class is

$$
c(\mathscr{E})=c_{0}(\mathscr{E})+\cdots+c_{r}(\mathscr{E}) \in A^{*}(X)
$$

## Proposition 1.3.1.

(1) $c_{0}(\mathscr{E})=1$ for any $\mathscr{E}$ and $c_{1}\left(\mathscr{O}_{X}\right)=1$ for any $X$.
(2) If $f: X \rightarrow Y$ is a morphism and $\mathscr{E}$ is locally free on $Y$, then $c_{i}\left(f^{*} \mathscr{E}\right)=$ $f^{*}\left(c_{i}(\mathscr{E})\right)$.
(3) If $0 \rightarrow \mathscr{E} \rightarrow \mathscr{F} \rightarrow \mathscr{G} \rightarrow 0$ is an exact sequence, then $c(\mathscr{F})=c(\mathscr{E}) c(\mathscr{G})$.
(4) $c_{i}\left(\mathscr{E}^{\vee}\right)=(-1)^{i} c_{i}(\mathscr{E})$, where $\mathscr{E}^{\vee}$ is the dual of $\mathscr{E}$.
(5) $c_{1}\left(\wedge^{r} \mathscr{E}\right)=c_{1}(\mathscr{E})$ when $\mathscr{E}$ has rank $r$.
(6) If $D$ is a Cartier divisor on $X$, then

$$
c_{1}\left(\mathscr{O}_{X}(D)\right)=D .
$$

Proof. See appendix A. 3 in [Har77].
1.3.2. Chern classes of coherent sheaf. Let $F(X)$ be the free abelian group generated by the set of coherent sheaves (up to isomorphisms, otherwise it's not a set) on $X$, that is, an element of $F(X)$ is a formal linear combination $\sum_{i} n_{i} \mathscr{F}_{i}$, where $n_{i} \in \mathbb{Z}$ and $\mathscr{F}_{i}$ is coherent. Let

$$
\text { (E) } 0 \rightarrow \mathscr{F}^{\prime} \rightarrow \mathscr{F} \rightarrow \mathscr{F}^{\prime \prime} \rightarrow 0
$$

be an exact sequence of sheaves, and we associate the element $Q(E)=\mathscr{F}$ -$\mathscr{F}^{\prime}-\mathscr{F}^{\prime \prime}$ of $F(X)$ to this exact sequence.

Definition 1.3.3. The group of classes of sheaves $K(X)$ on $X$ is defined to be the quotient of $F(X)$ by the subgroup generated by the $Q(E)$, where $E$ runs over all short exact sequences.

Definition 1.3.4. Let $F_{1}(X)$ be the free group generated by the set of locally free sheaves (up to isomorphisms), and $K_{1}(X)$ be the quotient of $F_{1}(X)$ by the subgroup generated by the $Q(E)$, where $E$ runs over all short exact sequences of locally free sheaves.

Theorem 1.3.1 ([BS58]). Let $X$ be a smooth quasi-projective variety. Then the homomorphism $\epsilon: K_{1}(X) \rightarrow K(X)$ is a bijection.

Corollary 1.3.1. The definition of Chern classes can be extended to arbitrary coherent sheaves.

### 1.4. Cones of divisors and curves.

1.4.1. The cones of divisors.

Definition 1.4.1. For two Cartier divisors $D_{1}, D_{2}$ on $X, D_{1}$ is numerically equivalent to $D_{2}$ if $D_{1} \cdot C=D_{2} \cdot C$ for all irreducible curves $C$.

Definition 1.4.2. The Néron-Severi group $N^{1}(X)$ is the quotient group of Cartier divisors by numerically equivalence, and

$$
N^{1}(X)_{\mathbb{Q}}=N_{1}(X) \otimes_{\mathbb{Z}} \mathbb{Q}, \quad N^{1}(X)_{\mathbb{R}}=N^{1}(X) \otimes_{\mathbb{Z}} \mathbb{R} .
$$

Theorem 1.4.1. The Néron-Severi group $N^{1}(X)$ is a free abelian group of finit rank, and the rank of $N^{1}(X)$ is said to be the Picard number.

Definition 1.4.3. For two 1 -cycles $C, C^{\prime}$ on $X, C$ is numerically equivalent to $C^{\prime}$ if they have the same intersection number with every Cartier divisor.

Notation 1.4.1. The quotient group of $Z_{1}(X)$ by numerically equivalence is denoted by $N_{1}(X)$, and

$$
N_{1}(X)_{\mathbb{Q}}=N_{1}(X) \otimes_{\mathbb{Z}} \mathbb{Q}, \quad N_{1}(X)_{\mathbb{R}}=N_{1}(X) \otimes_{\mathbb{Z}} \mathbb{R} .
$$

Remark 1.4.1. The intersection pairing

$$
N^{1}(X) \times N_{1}(X) \rightarrow \mathbb{Z}
$$

is by definition non-degenerate.
Definition 1.4.4. The cone of effective curves $N E(X)_{\mathbb{R}} \subseteq N_{1}(X)_{\mathbb{R}}$ is the cone spanned by non-negative linear combinations of curves, and $\overline{\mathrm{NE}}(X)_{\mathbb{R}}$ is the cone of pseudo-effective curves, where $N_{1}(X)_{\mathbb{R}}$ is endowed with its usual topology as a $\mathbb{R}$-vector space.

### 1.4.2. Nef cones and ample cones.

Definition 1.4.5. A Cartier divisor on $X$ is nef (numerically effective) if it has non-negative intersection with every irreducible curve on $X$.
Definition 1.4.6. The ample classes in $N^{1}(X)_{\mathbb{R}}$ forms an open cone $\mathrm{NA}(X)_{\mathbb{R}}$, which is said to be ample cone.

Definition 1.4.7. The nef classes in $N^{1}(X)_{\mathbb{R}}$ forms a closed cone $\operatorname{Nef}(X)_{\mathbb{R}}$, which is said to be nef cone.
Theorem 1.4.2. Let $X$ be a projective variety.
(1) The closure of the ample cone is the nef cone;
(2) The interior of nef cone is the ample cone.

Proof. See Theorem 1.4.23 in [Laz04].

Theorem 1.4.3. Let $X$ be a projective variety.
(1) The pseudo-effective cone is the closed cone dual to the nef cone, that is,

$$
\overline{\mathrm{NE}}(X)_{\mathbb{R}}=\left\{\gamma \in N_{1}(X)_{\mathbb{R}} \mid D \cdot \gamma \geq 0, \quad \forall D \in \overline{\mathrm{NA}}(X)_{\mathbb{R}}\right\}
$$

$$
\begin{equation*}
\mathrm{NA}(X)_{\mathbb{R}}=\left\{\gamma \in N^{1}(X)_{\mathbb{R}} \mid D \cdot \gamma>0, \quad \forall D \in \overline{\mathrm{NE}}(X)_{\mathbb{R}}-\{0\}\right\} . \tag{2}
\end{equation*}
$$

Proof. See Theorem 1.4.28 and Theorem 1.4.29 in [Laz04].

### 1.5. Asymptotic Riemann-Roch.

Theorem 1.5.1. Let $X$ be a projective variety of dimension $n$ and $D$ be a Cartier divisor on $X$. Then

$$
\chi(X, \mathscr{O}(m D))=\frac{D^{n}}{n!} m^{n}+O\left(m^{n-1}\right) .
$$

More generally, for any coherent sheaf $\mathscr{F}$ on $X$,

$$
\chi\left(X, \mathscr{F} \otimes \mathscr{O}_{X}(m D)\right)=\operatorname{rank} \mathscr{F} \cdot \frac{D^{n}}{n!} m^{n}+O\left(m^{n-1}\right) .
$$

Proof. See Theorem 1.1.24 in [Laz04].

## 2. Techniques

2.1. Semistable sheaves. Let $X$ be a normal projective variety of dimension $n$ over an algebraically closed field $k$ of arbitrary characteristic.

Definition 2.1.1. The average first Chern class of a torsion-free sheaf $\mathscr{E}$ is

$$
\delta(\mathscr{E})=\frac{c_{1}(\mathscr{E})}{\operatorname{rank} \mathscr{E}} \in A^{1}(X)_{\mathbb{Q}} .
$$

Definition 2.1.2. For a given $(n-1)$-tuple $\mathfrak{A}=\left(H_{1}, \ldots, H_{n-1}\right) \in \overline{\mathrm{NA}}(X)_{\mathbb{Q}}^{n-1}$, the average degree (or slope) with respect to $\mathfrak{A}$ is the rational number $\delta_{\mathfrak{A}}(\mathscr{E})=\delta(\mathscr{E}) H_{1} \ldots H_{n-1}$.

Definition 2.1.3. A torsion-free sheaf $\mathscr{E}$ is said to be semistable if

$$
\delta_{\mathfrak{A}}(\mathscr{F}) \leq \delta_{\mathfrak{A}}(\mathscr{E})
$$

for every non-zero subsheaf $\mathscr{F}$ of $\mathscr{E}$.
Notation 2.1. If $\mathfrak{A}=([H], \ldots,[H])$, we use the terminology $H$-semistable instead of $\mathfrak{A}$-semistable.

Theorem 2.1.1 ([HN75]). Let $\mathscr{E}$ be a torsion-free sheaf on $X$ and $\mathfrak{A} \in$ $\overline{\mathrm{NA}}(X)_{\mathbb{Q}}^{n-1}$. Then there exists a unique filtration $\Sigma_{\mathfrak{A}}$,

$$
0=\mathscr{E}_{0} \subsetneq \mathscr{E}_{1} \subsetneq \cdots \subsetneq \mathscr{E}_{s}=\mathscr{E},
$$

which is called the Harder-Narasimhan filtration, such that
(1) $\operatorname{Gr}_{i}\left(\Sigma_{\mathfrak{A}}\right)=\mathscr{E}_{i} / \mathscr{E}_{i+1}$ is a torsion-free $\mathfrak{A}$-semistable sheaf;
(2) $\delta_{\mathfrak{A}}\left(\operatorname{Gr}_{i}\left(\sum_{\mathfrak{A}}\right)\right)$ is a strictly decreasing function in $i$.

Sketch. Here we only give a sketch of proof of the existence. Put $\delta_{\mathfrak{A}}^{\max }(\mathscr{E}):=$ $\sup \left\{\delta_{\mathfrak{A}}(\mathscr{F}) \mid 0 \neq \mathscr{F} \subseteq \mathscr{E}\right.$ a coherent subsheaf\}. Then we need to prove that
(1) $\delta_{\mathfrak{A}}^{\max }(\mathscr{E})<\infty$;
(2) There exists a saturated subsheaf $\mathscr{F}_{1} \subseteq \mathscr{E}$ with maximal slope.

After that, suppose both $\mathscr{F}_{1}$ and $\mathscr{F}_{2}$ coherent subsheaves of rank $r_{1}$ and $r_{2}$ with maximal slope. By the following exact sequence

$$
0 \rightarrow \mathscr{F}_{1} \cap \mathscr{F}_{2} \rightarrow \mathscr{F}_{1} \oplus \mathscr{F}_{2} \rightarrow \mathscr{F}_{1}+\mathscr{F}_{2} \rightarrow 0,
$$

one has

$$
\begin{aligned}
c_{1}\left(\mathscr{F}_{1}+\mathscr{F}_{2}\right) & =c_{1}\left(\mathscr{F}_{1}\right)+c_{1}\left(\mathscr{F}_{2}\right)-c_{1}\left(\mathscr{F}_{1} \cap \mathscr{F}_{2}\right) \\
\operatorname{rank}\left(\mathscr{F}_{1}+\mathscr{F}_{2}\right) & =\operatorname{rank}\left(\mathscr{F}_{1}\right)+\operatorname{rank}\left(\mathscr{F}_{2}\right)-\operatorname{rank}\left(\mathscr{F}_{1} \cap \mathscr{F}_{2}\right) .
\end{aligned}
$$

Then

$$
\begin{aligned}
\operatorname{rank}\left(\mathscr{F}_{1}+\mathscr{F}_{2}\right) \delta_{\mathfrak{A}}\left(\mathscr{F}_{1}+\mathscr{F}_{2}\right) & =r_{1} \delta_{\mathfrak{A}}\left(\mathscr{F}_{1}\right)+r_{2} \delta_{\mathfrak{A}}\left(\mathscr{F}_{2}\right)-\operatorname{rank}\left(\mathscr{F}_{1} \cap \mathscr{F}_{2}\right) \delta_{\mathfrak{A}}\left(\mathscr{F}_{1} \cap \mathscr{F}_{2}\right) \\
& \geq\left(r_{1}+r_{2}\right) \delta_{\mathfrak{A}}^{\max }(\mathscr{E})-\operatorname{rank}\left(\mathscr{F}_{1} \cap \mathscr{F}_{2}\right) \delta_{\mathfrak{A}}^{\max }(\mathscr{E}) \\
& =\operatorname{rank}\left(\mathscr{F}_{1}+\mathscr{F}_{2}\right) \delta_{\mathfrak{A}}^{\max }(\mathscr{E}) .
\end{aligned}
$$

This shows $\mathscr{F}_{1}+\mathscr{F}_{2}$ also has maximal slope. By adding all these subsheaves together, this gives the maximal $\mathfrak{A}$-destabilizing subsheaf $\mathscr{E}_{1}$. We repeat above process to obtain the maximal $\mathfrak{A}$-destabilizing subsheaf of $\mathscr{E} / \mathscr{E}_{1}$, and consider its preimage to obtain $\mathscr{E}_{2}$, that is, $\mathscr{E}_{2} / \mathscr{E}_{1}=\left(\mathscr{E}_{1} / \mathscr{E}_{1}\right)_{1}$. It remains to show $\delta_{\mathfrak{A}}\left(\mathscr{E}_{1}\right)>\delta_{\mathfrak{A}}\left(\mathscr{E}_{2} / \mathscr{E}_{1}\right)$. Indeed, otherwise we would have $\delta_{\mathfrak{A}}\left(\mathscr{E}_{1}\right) \leq \delta_{\mathfrak{A}}\left(\mathscr{E}_{2}\right)$, a contradiction.

Remark 2.1.1. The maximal $\mathfrak{A}$-destabilizing subsheaf of $\mathscr{E}$ is characterized by the following properties:
(1) $\delta_{\mathfrak{A}}\left(\mathscr{E}_{1}\right) \geq \delta_{\mathfrak{A}}(\mathscr{F})$ for every coherent subsheaf $\mathscr{F}$ of $\mathscr{E}$;
(2) If $\delta_{\mathfrak{A}}\left(\mathscr{E}_{1}\right)=\delta_{\mathfrak{A}}(\mathscr{F})$ for $\mathscr{F} \subset \mathscr{E}$, then $\mathscr{F} \subset \mathscr{E}_{1}$.

Remark 2.1.2. The $\mathfrak{A}$-semistable filtration of the dual sheaf $\mathscr{E}^{*}$ is essentially the same as that of $\mathscr{E}$, with each entry substituted by the duals of the quotient $\mathscr{E} / \mathscr{E}_{s-i}$.
Theorem 2.1.2. Let $\mathscr{E}_{1}^{\mathfrak{A}} \subset \mathscr{E}$ denote the maximal $\mathfrak{A}$-destabilizing subsheaf for $\mathfrak{A} \in \overline{\mathrm{NA}}(X)_{\mathbb{Q}}^{n-1}$.
(1) Let $L$ be a closed affine segment joining $\mathfrak{A}, \mathfrak{C} \in \overline{\mathrm{NA}}(X)_{\mathbb{Q}}^{n-1}$ and $\mathfrak{B}=(1-$ $t) \mathfrak{A}+t \mathfrak{C}$ be a rational point on $L$. Then $\delta_{\mathfrak{A}\left(\mathscr{E}_{1}^{\mathfrak{B}}\right)=\delta_{\mathfrak{A}}\left(\mathscr{E}_{1}^{\mathfrak{A}}\right) \text { whenever } 0<~}^{\text {a }}$ $t<\epsilon$, where $\epsilon$ is a positive constant depends continously on $\mathfrak{C}$ provided $\mathscr{E}$ and $\mathfrak{A}$ is fixed.
(2) Let $K \subset \overline{\mathrm{NA}}(X)_{Q}^{n-1}$ be a compact subset and $\mathfrak{A} \in \overline{\mathrm{NA}}(X)_{\mathbb{Q}}^{n-1}$ is away from $K$. Let $\mathfrak{A} \sharp K$ stands the union of the segments joining $\mathfrak{A}$ and $K$. Then there exists an open neighborhood $U \subset N^{1}(X)_{\mathbb{Q}}$ of $\mathfrak{A}$ such that $\delta_{\mathfrak{A}}\left(\mathscr{E}_{1}^{\mathfrak{B}}\right)=$ $\delta_{\mathfrak{A}}\left(\mathscr{E}_{1}^{\mathfrak{A}}\right)$ for every $\mathfrak{B} \in U \cap(\mathfrak{A} \sharp K) \cap \overline{\mathrm{NA}}(X)_{\mathbb{Q}}^{n-1}$.
(3) If $\mathfrak{A} \in \mathrm{NA}(X)_{\mathbb{Q}}^{n-1}$, then there exists an open neighborhood $U \subset \mathrm{NA}(X)_{\mathbb{Q}}^{n-1}$ of $\mathfrak{A}$ such that $\delta_{\mathfrak{A}}\left(\mathscr{E}_{1}^{\mathfrak{B}}\right)=\delta_{\mathfrak{A}}\left(\mathscr{E}_{1}^{\mathfrak{A}}\right)$ for every $\mathfrak{B} \in U$.
Proof. For simplicity, we show the case $n=2$ only, and the proof is quite similar for higher dimensions.
(1). Suppose $\mathfrak{C}=H \in \overline{\mathrm{NA}}(X)_{\mathbb{Q}}$. If $\mathscr{E}^{*}(H)$ is globally generated, that is, there exists a surjective morphism $\mathscr{O}_{X}^{\oplus N} \rightarrow \mathscr{E}^{*}(H)$ for some integer $N$. By taking dual we have an injective morphism $\mathscr{E} \rightarrow \mathscr{O}_{X}^{\oplus N}(H)$, and thus

$$
\delta_{\mathfrak{C}}\left(\mathscr{E}_{1}^{\mathfrak{B}}\right) \leq c
$$

where $c$ is a constant depending on $\mathscr{E}$, and on $\mathfrak{C}$ continously. If $H$ is ample, then there exists some integer $m$ such that $m H$ is globally generated, and thus in this case $\delta_{\mathfrak{C}}\left(\mathscr{E}_{1}^{\mathscr{B}}\right) \leq c$ for some constant $c$ depending on $\mathscr{E}$, and on $\mathfrak{C}$ continously. Finally if $H \in \overline{\mathrm{NA}}(X)_{\mathbb{Q}}$, we also have the same result, as it's a limit of ample divisors. Furthermore, we put $c^{\prime}=\delta_{\mathfrak{C}}\left(\mathscr{E}_{1}^{\mathscr{A}}\right)$. By the definition of the maximal destabilizing sheaves, we get

$$
\delta_{\mathfrak{B}}\left(\mathscr{E}_{1}^{\mathfrak{A}}\right) \leq \delta_{\mathfrak{B}}\left(\mathscr{E}_{1}^{\mathfrak{B}}\right)
$$

As $\delta_{\mathfrak{B}}$ is a linear function in $\mathfrak{B}=(1-t) \mathfrak{A}+t \mathfrak{C}$, this inequality is rewritten as

$$
(1-t) \delta_{\mathfrak{A}}\left(\mathscr{E}_{1}^{\mathfrak{A}}\right)+t \delta_{\mathfrak{C}}\left(\mathscr{E}_{1}^{\mathfrak{A}}\right) \leq(1-t) \delta_{\mathfrak{A}}\left(\mathscr{E}_{1}^{\mathfrak{B}}\right)+t \delta_{\mathfrak{C}}\left(\mathscr{E}_{1}^{\mathfrak{B}}\right)
$$

Hence

$$
\begin{aligned}
\delta_{\mathfrak{A}}\left(\mathscr{E}_{1}^{\mathfrak{B}}\right) \leq \delta_{\mathfrak{A}}\left(\mathscr{E}_{1}^{\mathfrak{A}}\right) & \leq \delta_{\mathfrak{A}}\left(\mathscr{E}_{1}^{\mathfrak{B}}\right)+\frac{t}{1-t}\left(\delta_{\mathfrak{C}}\left(\mathscr{E}_{1}^{\mathfrak{B}}\right)-\delta_{\mathfrak{C}}\left(\mathscr{E}_{1}^{\mathfrak{A}}\right)\right) \\
& \leq \delta_{\mathfrak{A}}\left(\mathscr{E}_{1}^{\mathfrak{B}}\right)+\frac{t}{1-t}\left(c-c^{\prime}\right) .
\end{aligned}
$$

Note that $\delta\left(\mathscr{E}_{1}^{\mathfrak{A}}\right), \delta\left(\mathscr{E}_{1}^{\mathfrak{B}}\right) \in(1 / r!) A^{1}(X)_{\mathbb{Z}}$ and $\mathfrak{A} \in(1 / m) N^{1}(X)_{\mathbb{Z}}$ for some positive integer $m$. Therefore, if

$$
\frac{t}{1-t}\left(c-c^{\prime}\right)<\frac{1}{r!m},
$$

then $\delta_{\mathfrak{A}}\left(\mathscr{E}_{1}^{\mathfrak{A}}\right)=\delta_{\mathfrak{A}}\left(\mathscr{E}_{1}^{\mathscr{B}}\right)$.
(2). Let $U$ be the open ball centered at $\mathfrak{A}$ with radius $r$, where $r=$ $\inf _{\mathfrak{C} \in K} \epsilon(\mathscr{E}, \mathfrak{A}, \mathfrak{C}) d(\mathfrak{A}, \mathfrak{C}), d$ standing for Euclidean metric.
(3). Let $K \subset \mathrm{NA}(X)_{\mathbb{Q}}^{n-1}$ be a sphere centered at $\mathfrak{A}$ and apply (2).

Corollary 2.1.1. Given a compact subset $K \subset \overline{\mathrm{NA}}(X)_{\mathbb{Q}}^{n-1}$ and $\mathfrak{A} \in \overline{\mathrm{NA}}(X)_{\mathbb{Q}}^{n-1}$ is away from $K$, the $\mathfrak{B}$-semistable filtration is a refinement of $\mathfrak{A}$-semistable filtration for all $\mathfrak{B} \in \mathfrak{A} \sharp K$ sufficiently near $\mathfrak{A}$.

Proof. By (2) of above theorem, we have $\mathscr{E}_{1}^{\mathfrak{B}} \subseteq \mathscr{E}_{1}^{\mathscr{A}}$ for all $\mathfrak{B} \in \mathfrak{A} \sharp K$ sufficiently near $\mathfrak{A}$. If $\mathscr{E}$ is semistable, it's clear that the $\mathfrak{B}$-semistable filtration of $\mathscr{E}$ is a refinement of $\mathfrak{A}$-semistable filtration of $\mathscr{E}$, and the general case is obtained by repeating above process for each semistable grade $\mathscr{E}_{i} / \mathscr{E}_{i+1}$.

Corollary 2.1.2. Let $\mathscr{E}$ be a torsion-free sheaf on $X$. Then the function $\delta_{\mathfrak{A}}\left(\mathscr{E}_{1}^{\mathscr{A}}\right)$ is continous on $\mathrm{NA}(X)_{\mathbb{Q}}^{n-1}$, and is continous on any rational segment of $\overline{\mathrm{NA}}(X)_{\mathbb{Q}}^{n-1}$.

Proof. Note that if both $\mathfrak{A}$ and $\mathfrak{B}$ in $\mathrm{NA}(X)_{\mathbb{Q}}^{n-1}$, then there exists some open neighborhood of $\mathfrak{A}$ containing $\mathfrak{B}$, and there also exists some open neighborhood of $\mathfrak{B}$ containing $\mathfrak{A}$. By the symmetry we have $\mathscr{E}_{1}^{\mathfrak{B}}=\mathscr{E}_{1}^{\mathscr{A}}$, and thus
$\delta_{\mathfrak{A}}\left(\mathscr{E}_{1}^{\mathscr{A}}\right)$ is continous on $\mathrm{NA}(X)_{\mathbb{Q}}^{n-1}$. The same arguement shows $\delta_{\mathfrak{A}}\left(\mathscr{E}_{1}^{\mathscr{A}}\right)$ is also continous in any rational segment of $\overline{\mathrm{NA}}(X)_{\mathbb{Q}}^{n-1}$.
2.2. A numerical criterion for semistability on curves. Throught this section, the ground field $k$ is always an algebraically closed field with characteristic 0 except Lemma 2.2.1, and $C$ is a smooth complete curve.
2.2.1. Projective bundle on curves. Let $\mathscr{E}$ be a locally free sheaf of rank $r$ on $C$ and $\pi: \mathbb{P}(\mathscr{E}) \rightarrow C$ the associated projective bundle with tautological line bundle $\mathscr{O}_{\mathbb{P}(\mathscr{E})}(1)$.

Definition 2.2.1. The normalized hyperplane class $\lambda_{\mathscr{E}}$ is the numerical class of $c_{1}\left(\mathscr{O}_{\mathbb{P}(\mathscr{E})}(1)\right)-\pi^{*} \delta(\mathscr{E}) \in N^{1}(\mathbb{P}(\mathscr{E}))_{\mathbb{Q}}$.

Remark 2.2.1. The normalized hyperplane class $\lambda_{\mathscr{E}}$ is uniquely determined by two properties:
(1) $\lambda_{\mathscr{E}}^{r}=0$.
(2) $\lambda_{\mathscr{E}}$ on each fiber is numerically equivalent to the hyperplane.

Proposition 2.2.1. The class of relative anti-canonical divisor $-K_{\mathbb{P}(\mathscr{E})}+$ $\pi^{*} K_{C}$ equals $r \lambda_{\mathscr{E}}$.

Proof. It follows from the relative Euler sequence, that is,

$$
0 \rightarrow \Omega_{\mathbb{P}(\mathscr{E}) / C}^{1} \rightarrow \mathscr{O}_{\mathbb{P}(\mathscr{E})}(-1) \otimes \pi^{*} \mathscr{E}^{*} \rightarrow \rightarrow \mathscr{O}_{\mathbb{P}(\mathscr{E})} \rightarrow 0 .
$$

## Proposition 2.2.2.

(1) $\pi_{*}\left(\mathscr{O}_{\mathbb{P}(\mathscr{E})}(\ell)\right)=\mathscr{S}^{\ell} \mathscr{E}$ for $\ell \geq 0$ and $\pi_{*}\left(\mathscr{O}_{\mathbb{P}(\mathscr{E})}(\ell)\right)=0$ for $\ell<0$.
(2) $R^{i} \pi_{*}\left(\mathscr{O}_{\mathbb{P}(\mathscr{E})}(\ell)\right)=0$ for $0<i<n$.
(3) $R^{n} \pi_{*}\left(\mathscr{O}_{\mathbb{P}(\mathscr{E})}(\ell)\right)=0$ for $\ell>-n-1$.

Proof. See Exercise III 8.4 in [Har77].
Proposition 2.2.3. The Néron-Severi group of $\mathbb{P}(\mathscr{E})$ is

$$
N^{1}(\mathbb{P}(\mathscr{E}))=\mathbb{R} \lambda_{\mathscr{E}} \oplus \pi^{*} N^{1}(X),
$$

and the group of numerically equivalent 1-cycles is

$$
N_{1}(\mathbb{P}(\mathscr{E}))=\lambda_{\mathscr{E}}^{r-2} N^{1}(\mathbb{P}(\mathscr{E})) .
$$

Proof. See Proposition V 2.3 in [Har77].

### 2.2.2. Criterion.

Lemma 2.2.1. Let $f$ be a seperable surjective $k$-morphism of a smooth complete curve $C^{\prime}$ onto $C$. Then a locally free sheaf $\mathscr{E}$ is semistable if and only if $f^{*} \mathscr{E}$ is semistable.
Proof. Firstly let's prove "if" part. Let $\mathscr{G} \subseteq \mathscr{E}$ be a non-zero subsheaf. Then $\delta\left(f^{*} \mathscr{G}\right) \leq \delta\left(f^{*} \mathscr{E}\right)$ as $f^{*} \mathscr{E}$ is semistable, and thus $\delta(\mathscr{G}) \leq \delta(\mathscr{F})$.

Conversely, suppose $\mathscr{E}$ is semistable. Without lose of generality we may assume $f$ is a Galois morphism with Galois group $G$, which acts on $f^{*} \mathscr{E}$. If $f^{*} \mathscr{E}$ is not semistable and $\mathscr{F}_{1}$ be the maximal destabilizing subbundle of $f^{*} \mathscr{E}$. For any $g \in G$, we have $g^{*} \mathscr{F}_{1}=\mathscr{F}_{1}$ as the maximal destabilizing subsheaf is unique. Hence there exists a subbundle $\mathscr{E}_{1}$ of $\mathscr{E}$ such that $f^{*} \mathscr{E}_{1}=\mathscr{F}_{1}$, and by "if" part $\mathscr{E}_{1}$ is semistable. On the other hand, by semistability we have $\mathscr{E}_{1}=\mathscr{E}$, and thus $\mathscr{F}_{1}=f^{*} \mathscr{E}$. This completes the proof.

Theorem 2.2.1. The following conditions are equivalent:
(1) $\mathscr{E}$ is semistable;
(2) $\lambda_{\mathscr{E}}$ is nef;
(3) $\overline{\mathrm{NA}}(\mathbb{P}(\mathscr{E}))=\mathbb{R}_{+} \lambda_{\mathscr{E}} \oplus \mathbb{R}_{+} \pi^{*} d$, where $d$ is a positive generator of $N^{1}(C)_{\mathbb{Z}} \cong$ $\mathbb{Z}$;
(4) $\overline{\mathrm{NE}}(\mathbb{P}(\mathscr{E}))=\mathbb{R}_{+} \lambda_{\mathscr{E}}^{r-1} \oplus \mathbb{R}_{+} \lambda_{\mathscr{E}}^{r-2} \pi^{*} d$;
(5) Every effective divisor on $\mathbb{P}(\mathscr{E})$ is nef.

Proof. (1) to (2). If $\lambda_{\mathscr{E}}$ is not nef, then there exists an irreducible curve $C^{\prime} \subset \mathbb{P}(\mathscr{E})$ with $C^{\prime} \lambda_{\mathscr{E}}<0$. It's clear ${ }^{2}$ that $C^{\prime}$ is mapped surjectively onto $C$. Let $C^{\prime \prime}$ be the normalization of $C^{\prime}$ and $f: C^{\prime \prime} \rightarrow C$ be the composition of $C^{\prime \prime} \rightarrow C^{\prime} \rightarrow C$. Then by the base change $f: C^{\prime \prime} \rightarrow C$, the multi-section $C^{\prime}$ becomes a union of cross sections $C_{i}^{\prime \prime}$ on the projective bundle $\mathbb{P}\left(f^{*} \mathscr{E}\right)$ over $C^{\prime \prime}$, and $C_{i}^{\prime \prime} \lambda_{\mathbb{P}\left(f^{*} \mathscr{E}\right)}$ is evidently negative since $C^{\prime} \lambda_{\mathscr{E}}<0$. For a section $s: C \rightarrow$ $C_{i}^{\prime \prime} \subset \mathbb{P}\left(f^{*} \mathscr{E}\right)$, it gives a line bundle $\mathscr{L}=s^{*} \mathscr{O}_{\mathbb{P}}\left(f^{*} \mathscr{E}\right)(1)$ on $C$, which has degree $C_{i}^{\prime \prime} c_{1}\left(\mathscr{O}_{\mathbb{P}\left(f^{*} \mathscr{E}\right)}(1)\right)=C_{i}^{\prime \prime} \lambda_{f^{*} \mathscr{E}}+\delta\left(f^{*} \mathscr{E}\right)<\delta\left(f^{*} \mathscr{E}\right)$, so that $f^{*} \mathscr{E}$ is unstable, and thus $\mathscr{E}$ is unstable by Lemma 2.2.1.

[^1](2) to (4). If $\lambda_{\mathscr{E}}^{r-2}\left(a \lambda_{\mathscr{E}}+b \pi^{*} d\right)$ is pseudo-effective and $\lambda_{\mathscr{E}}$ is nef, then
$$
b=\lambda_{\mathscr{E}}^{r-1}\left(a \lambda_{\mathscr{E}}+b \pi^{*} d\right) \geq 0 .
$$

On the other hand, $\lambda_{\mathscr{E}}^{r-1}$ is pseudo-effective since $\lambda_{\mathscr{E}}$ is nef, and thus $a \geq 0$.
The equivalent between (3) and (4) is straightforward since the nef cone is the closed cone dual to the pseudo-effective cone (Theorem 1.4.3).
(3) and (4) to (5). Since $\lambda_{\mathscr{E}}$ is nef, $\lambda_{\mathscr{E}}+\epsilon \pi^{*} d$ is ample for any positive real number $\epsilon$. Assume $a \lambda_{\mathscr{E}}+b \pi^{*} d$ is an effective divisor. Then the 1cycles $\left(a \lambda_{\mathscr{E}}+b \pi^{*} d\right)\left(\lambda_{\mathscr{E}}+\epsilon \pi^{*} d\right)^{r-2}$ is effective, and thus their limit $\left(a \lambda_{\mathscr{E}}+\right.$ $\left.b \pi^{*} d\right) \lambda_{\mathscr{E}}^{r-2}$ is pseudo-effective. Then by (4) one has $a, b \geq 0$, and thus $a \lambda_{\mathscr{E}}+$ $b \pi^{*} d$ is nef by (3).
(5) to (1). Suppose that $\mathscr{E}$ is unstable and let $\mathscr{E}_{1}$ be the maximal destabilizing subbundle. Let $\alpha$ be a rational number with $\delta\left(\mathscr{E}_{1}\right)>\alpha>\delta(\mathscr{E})$. Then by the Riemann-Roch theorem,

$$
\begin{aligned}
H^{0}\left(C, \mathscr{S}^{N} \mathscr{E}_{1}(-N \alpha d)\right) \subseteq & H^{0}\left(C, \mathscr{S}^{N} \mathscr{E}(-N \alpha d)\right) \\
& \left.\cong H^{0}\left(\mathbb{P}(\mathscr{E}), \mathscr{O}_{\mathbb{P}(\mathscr{E})}(N) \otimes \pi^{*} \mathscr{O}_{C}(-N \alpha d)\right)\right)
\end{aligned}
$$

is non-trivial for sufficiently large $N$. Then $N\left\{\lambda_{\mathscr{E}}+(\delta(\mathscr{E})-\alpha) \pi^{*} d\right\}$ is effective but clearly not nef.

### 2.2.3. Semipositive and semistability.

Definition 2.2.2. Let $D$ be a $\mathbb{Q}$-Cartier divisor on $C$. A $\mathbb{Q}$-torsion-free sheaf $\mathscr{F}=\mathscr{E}(D)$ is said to be ample or semipositive if $\xi+\pi^{*} D$ is ample or nef, where $\xi=c_{1}\left(\mathscr{O}_{\mathbb{P}(\mathscr{E})}(1)\right)$.

Definition 2.2.3. A $\mathbb{Q}$-torsion-free sheaf $\mathscr{F}$ is said to be negative or seminegative if $\mathscr{F}^{*}$ is ample or semipositive.

Proposition 2.2.4. The direct sums, tensor products, symmetric products and exterior products of ample (or semipositive) $\mathbb{Q}$-torsion-free sheaves are all ample (or semipositive).

Theorem 2.2.2. Let $\mathscr{E}$ be a vector bundle on $C$. Then $\mathscr{E}$ is semistable if and only if $\mathscr{E}(-\delta(E))$ is semipositive.
Proof. It follows from Theorem 2.2.1.
Corollary 2.2.1. Let $\mathscr{E}$ be a vector bundle on $C$. Then $\mathscr{E}$ is semistable if and only if $\mathscr{E}(-\delta(E))$ is seminegative.

Proof. It suffices to note that $\mathscr{E}$ is semistable if and only if $\mathscr{E}^{*}$ is semistable.

## Corollary 2.2 .2 .

(1) The $\mathbb{Q}$-vector bundle $\mathscr{E}(-D)$ is seminegative if and only if $\operatorname{deg} D \geq \operatorname{deg} \delta\left(\mathscr{E}_{1}\right)$, where $\mathscr{E}_{1}$ is the maximal destabilizing subsheaf of $\mathscr{E}$.
(2) The $\mathbb{Q}$-vector bundle $\mathscr{E}(-D)$ is negative if and only if $\operatorname{deg} D>\operatorname{deg} \delta\left(\mathscr{E}_{1}\right)$, where $\mathscr{E}_{1}$ is the maximal destabilizing subsheaf of $\mathscr{E}$.
(3) The $\mathbb{Q}$-vector bundle $\mathscr{E}(D)$ is semipositive if and only if $\operatorname{deg} D \geq \operatorname{deg} \delta\left(\left(\mathscr{E}^{*}\right)_{1}\right)$.
(4) The $\mathbb{Q}$-vector bundle $\mathscr{E}(D)$ is positive if and only if $\operatorname{deg} D>\operatorname{deg} \delta\left(\left(\mathscr{E}^{*}\right)_{1}\right)$.

Proof. For simplicity we only prove the first statement, and the proof is quite similar for others.

Let $\mathscr{E}_{1} \subset \cdots \subset \mathscr{E}_{s}=\mathscr{E}$ be the semistable filtration of $\mathscr{E}$. Since $\mathscr{G}_{i}=\mathscr{E}_{i} / \mathscr{E}_{i-1}$ is semistable and $\operatorname{deg} \delta\left(\mathscr{G}_{i}\right)$ is decreasing in $i$, one has $\mathscr{G}_{i}\left(-\delta\left(\mathscr{E}_{1}\right)\right)$ is seminegative for all $i$, and thus $\mathscr{E}\left(-\delta\left(\mathscr{E}_{1}\right)\right)$ is seminegative. If $\operatorname{deg} D \geq \operatorname{deg} \delta\left(\mathscr{E}_{1}\right)$, then $\mathscr{E}(-D)$ is also seminegative.

Conversely, if $\operatorname{deg} D$ is smaller than $\operatorname{deg} \delta\left(\mathscr{E}_{1}\right)$ for a $\mathbb{Q}$-divisor $D$, then $\mathscr{E}(-D)$, containing an ample $\mathbb{Q}$-vector bundle $\mathscr{E}_{1}(-D)$, is never seminegative.

Corollary 2.2.3. A semistable vector bundle $\mathscr{E}$ on $C$ is ample (resp. semipositive, seminegative, negative) if and only if its degree is positive (resp. semipositive, seminegative, negative).

Proof. Take $D=0$ in Corollary 2.2.2.
Corollary 2.2.4. Let $\mathscr{E}$ and $\mathscr{F}$ be semistable bundles on $C$. Then $\mathscr{E} \otimes \mathscr{F}$ and $\mathscr{H} \operatorname{com}(\mathscr{E}, \mathscr{F})$ are also semistable.

Proof. It follows from the semipositive bundle tensor with semipositive bundle is still semipositive.

Corollary 2.2.5. Let $\mathscr{E}$ and $\mathscr{F}$ be two vector bundles. Then $\mathscr{H} \operatorname{com}(\mathscr{E}, \mathscr{F})$ is negative if and only if $\operatorname{deg} \delta\left(\mathscr{F}_{1}\right)+\operatorname{deg} \delta\left(\left(\mathscr{E}^{*}\right)_{1}\right)<0$. As a consequence, $\mathscr{H} \operatorname{om}\left(\mathscr{E}_{1}, \mathscr{E}_{1} / \mathscr{E}_{1}\right)$ is negative.
Proof. For the first part, note that $\mathscr{H} \operatorname{om}(\mathscr{E}, \mathscr{F})=\mathscr{E}^{*} \otimes \mathscr{F}$ and take $D=0$ in Corollary 2.2.2. For the half part, it suffices to note $\left(\mathscr{E} / \mathscr{E}_{1}\right)_{1}=\mathscr{E}_{2} / \mathscr{E}_{1}$.
Corollary 2.2.6. A vector bundle is semistable if and only if $\mathscr{S}^{n} \mathscr{E}$ is semistable, where $n \geq 2$.

Proposition 2.2.5. Let $\mathscr{E}$ be a vector bundle on $C$. The following conditions are equivalent:
(1) $\mathscr{E}$ is semistable;
(2) $\mathscr{E}(-D)$ is negative with $D$ is a $\mathbb{Q}$-divisor of degree $\delta(\mathscr{E})+(1 / 2 r!)$.

Proof. The implication (1) to (2) follows from Corollary 2.2.1.

Conversely, assume (2) and let $\mathscr{E}_{1}$ be the maximal destabilizing subsheaf. Then by Corollary 2.2 .2 we have $\mathscr{E}(-D)$ is negative if and only if $\operatorname{deg} D>$ $\operatorname{deg} \delta\left(\mathscr{E}_{1}\right)$ so that

$$
\delta(\mathscr{E}) \leq \delta\left(\mathscr{E}_{1}\right)<\delta(\mathscr{E})+\frac{1}{2 r!}
$$

On the other hand, both $\operatorname{deg} \delta\left(\mathscr{E}_{1}\right)$ and $\operatorname{deg} \delta(\mathscr{E})$ sit in $(1 / r!) \mathbb{Z}$. Hence we have $\operatorname{deg} \delta\left(\mathscr{E}_{1}\right)=\operatorname{deg} \delta(\mathscr{E})$, and thus $\mathscr{E}_{1} \cong \mathscr{E}$.

Corollary 2.2.7. Let $\mathscr{C} \rightarrow T$ be a proper smooth family of irreducible curves, where $\mathscr{C}$ and $T$ are $k$-varieties. Let $\mathscr{E}$ be a vector bundle on $\mathscr{C}$. Then the set

$$
S(T)=\left\{t \in T \mid \mathscr{E} \text { is semistable on } C_{t}\right\}
$$

is a Zariski open subset of $T$.

### 2.3. Mumford-Mehta-Ramanathan's theorem.

Theorem 2.3.1 ([MR82]). Let $X$ be a complex normal projective variety of dimension $n$ and $\mathscr{E}$ be a torsion-free sheaf. Let $H_{1}, \ldots, H_{n-1}$ be ample Cartier divisors. Then for sufficiently large integers $m_{1}, \ldots, m_{n-1}$, the maximal destabilizing subsheaf $\mathscr{F}$ of $\left.\mathscr{E}\right|_{C}$ extends to a saturated subsheaf of $\mathscr{E}$ on $X$ if $C$ is a general complete intersection curve of $\left|m_{i} H_{i}\right|$ 's. (Such an extension of $\mathscr{F}$ is necessarily the maximal ( $H_{1}, \ldots, H_{n-1}$ )-destabilizing subsheaf of $\mathscr{E}$ and hence unique.)
2.4. The Bogomolov-Gieseker inequality for semistable sheaves. In this section, the ground field $k$ is always algebraically closed of characteristic zero.

Lemma 2.4.1. Let $X$ be a normal projective variety of dimension $n$ and $\mathfrak{A} \in \mathrm{NA}(X)^{n-1}$. Let $\mathscr{E}$ be an $\mathfrak{A}$-semistable torsion-free sheaf on $X$, with its first Chern class being a $\mathbb{Q}$-Cartier divisor. Let $D$ be a non-zero effective Cartier divisor on $X$. Then

$$
H^{0}\left(X, \mathscr{S}^{r t} \mathscr{E}\left(-t c_{1}(\mathscr{E})-D\right)\right)=0
$$

for every positive integer $t$ such that $t c_{1}(\mathscr{E})$ is an integral Cartier divisor.
Proof. For a generic curve $C$ in $X$, by Theorem 2.3 .1 one has $\left.\mathscr{S}^{r t} \mathscr{E}\left(-t c_{1}(\mathscr{E})\right)\right|_{C}$ is semistable since $\mathscr{S}^{r t} \mathscr{E}$ is semistable. If

$$
H^{0}\left(X, \mathscr{S}^{r t} \mathscr{E}\left(-t c_{1}(\mathscr{E})-D\right)\right) \neq 0
$$

then there is an inclusion $\left.\mathscr{O}_{C}(D) \rightarrow \mathscr{S}^{r t} \mathscr{E}\left(-t c_{1}(\mathscr{E})\right)\right|_{C}$. But $\operatorname{deg} \delta\left(\mathscr{O}_{C}(D)\right)>0$ since $D$ is effective and $\mathscr{S}^{r t} \mathscr{E}\left(-t c_{1}(\mathscr{E})\right)=\mathscr{S}^{r t}\{\mathscr{E}(-\delta(\mathscr{E}))\}$ has degree zero on every curve. This contradicts to $\left.\mathscr{S}^{r t} \mathscr{E}\left(-t c_{1}(\mathscr{E})\right)\right|_{C}$ is semistable.

Corollary 2.4.1. Let things be as Lemma 2.4 .1 and $L$ be a fixed Cartier divisor. Then $h^{0}\left(X, \mathscr{S}^{r t} \mathscr{E}\left(-t c_{1}(\mathscr{E})+L\right)\right)$ is bounded by a polynomial of degree $r-1$ in $t$.

Proof. For simplicity of the notation, put $\mathscr{F}^{t}=\mathscr{S}^{r t} \mathscr{E}\left(-t c_{1}(\mathscr{E})\right)$. The proof is by induction on the dimension $n$ of $X$. If $n=1$, let $D$ be a reduced effective divisor of degree $d>\operatorname{deg} L$. Then there is a natural exact sequence

$$
H^{0}\left(X, \mathscr{F}^{t}(-D)\right) \rightarrow H^{0}\left(X, \mathscr{F}^{t}(L)\right) \rightarrow H^{0}\left(D, \mathscr{F}^{t}(L)\right)
$$

of which the first term vanishes by Lemma 2.4.1, where the last term is a $k$-vector space of dimension $d\binom{r t+r-1}{r t}=d\binom{r t+r-1}{r-1}$. This completes the proof of $n=1$.

For $n \geq 2$, let $\mathfrak{A}=\left(H_{1}, \ldots, H_{n}\right)$ in $\mathrm{NA}(X)^{n-1}$, where $H_{i}$ is integral and ample. Let $Y$ be a general hyperplane section in $\left|m H_{i}\right|$ for sufficiently large $m$ such that $\left.\mathscr{E}\right|_{Y}$ is $\left(H_{1}, \ldots, H_{n-2}\right)$-semistable on $Y$ and $Y-L$ is ample (Note that such a number $m$, though possible very large, is independent of $t$ ). Consider the exact sequence

$$
H^{0}\left(X, \mathscr{F}^{t}(L-Y)\right) \rightarrow H^{0}\left(X, \mathscr{F}^{t}(L)\right) \rightarrow H^{0}\left(Y, \mathscr{F}^{t}(L)\right) .
$$

The first term vanishes by Lemma 2.4.1 and the dimension of the last term is bounded by a polynomial of degree $r-1$ by the induction hypothesis. This completes the proof.

Theorem 2.4.1 (The Bogomolov-Gieseker inequality). Let $S$ be a smooth projective surface over $k$. If $\mathscr{E}$ is an $H$-semistable torsion-free sheaf of rank $r$ on $S$, where $H$ is an ample divisor, then

$$
(r-1) c_{1}^{2}(\mathscr{E}) \leq 2 r c_{2}(\mathscr{E})
$$

Proof. From Corollary 2.4.1, it follows that neither $h^{0}\left(S, \mathscr{S}^{r t} \mathscr{E}\left(-t c_{1}(\mathscr{E})\right)\right)$ nor $h^{2}\left(S, \mathscr{S}^{r t} \mathscr{E}\left(-t c_{1}(\mathscr{E})\right)=h^{0}\left(S, \mathscr{S}^{r t} \mathscr{E}^{*}\left(-t c_{1}\left(\mathscr{E}^{*}\right)\right)+K_{S}\right)\right.$ grows like $t^{r+1}$. Hence we obtain the inequality

$$
\chi\left(S, \mathscr{S}^{r t} \mathscr{E}\left(-t c_{1}(\mathscr{E})\right)\right) \leq \text { polynomial of degree } r \text { in } t .
$$

On the other hand, we have

$$
\begin{aligned}
\chi\left(S, \mathscr{S}^{r t} \mathscr{E}\left(-t c_{1}(\mathscr{E})\right)\right) & \stackrel{(1)}{=} \chi\left(\mathbb{P}(\mathscr{E}), \mathscr{O}_{\mathbb{P}(\mathscr{E})}(r t) \otimes \pi^{*} \mathscr{O}_{S}\left(-t c_{1}(\mathscr{E})\right)\right) \\
& \stackrel{(2)}{=} \frac{t^{r+1}}{(r+1)!}\left\{r c_{1}\left(\mathscr{O}_{\mathbb{P}(\mathscr{E}}(1)\right)-\pi^{*} c_{1}(\mathscr{E})\right\}^{r+1}+O\left(t^{r}\right) \\
& \stackrel{(3)}{=} \frac{(r t)^{r+1}}{(r+1)!}\left\{-c_{2}(\mathscr{E})+\frac{r-1}{2 r} c_{1}^{2}(\mathscr{E})\right\}+O\left(t^{r}\right),
\end{aligned}
$$

where
(1) holds from the projection formula;
(2) holds from by the asymptotic Riemann-Roch theorem (Theorem 1.5.1);
(3) holds from the following standard computation

$$
\begin{aligned}
\left\{\xi-\frac{\pi^{*} c_{1}(\mathscr{E})}{r}\right\}^{r+1} & =\left\{\xi^{r}-\pi^{*} c_{1}(\mathscr{E}) \xi^{r-1}+\frac{r-1}{2 r} \pi^{*} c_{1}^{2}(\mathscr{E}) \xi^{r-2}\right\}\left\{\xi-\frac{\pi^{*} c_{1}(\mathscr{E})}{r}\right\} \\
& =\left\{\pi^{*} c_{2}(\mathscr{E}) \xi^{r-2}+\frac{r-1}{2 r} \pi^{*} c_{1}^{2}(\mathscr{E}) \xi^{r-2}\right\}\left\{\xi-\frac{\pi^{*} c_{1}(\mathscr{E})}{r}\right\} \\
& =\left\{-c_{2}(\mathscr{E})+\frac{r-1}{2 r} c_{1}^{2}(\mathscr{E})\right\},
\end{aligned}
$$

where $\xi=c_{1}\left(\mathscr{O}_{\mathbb{P}(\mathscr{E})}(1)\right)$.
This completes the proof.
Corollary 2.4.2. Let $\mathscr{E}$ be a locally free sheaf of rank $r$ on a smooth surface $S$. Let $L$ be an ample integral divisor on $S$ such that $\mathscr{E}(-\delta(\mathscr{E})+L)$ is ample and $\mathscr{E}(-\delta(\mathscr{E})-L)$ is negative (as $\mathbb{Q}$-vector bundles). Assume the inequality $2 r c_{2}(\mathscr{E})<(r-1) c_{1}^{2}(\mathscr{E})$ and put

$$
\alpha=\frac{(r-1) c_{1}^{2}(\mathscr{E})-2 r c_{2}(\mathscr{E})}{6 r^{2}(r+1) L^{2}} \in \mathbb{Q} .
$$

Then
(1) Either $\mathscr{S}^{t} \mathscr{E}(-t \delta(\mathscr{E}))$ or $\mathscr{S}^{t} \mathscr{E}^{*}\left(-t \delta\left(\mathscr{E}^{*}\right)\right)$ contains the ample line bundle $\mathscr{O}_{S}(t \alpha L)$, where $t$ is any very large integer such that $t \delta(\mathscr{E})$ and $t \alpha$ are integral.
(2) For any nef divisor $D$, the maximal $D$-destabilizing subsheaf $\mathscr{E}_{1}^{D}$ has normalized degree not less that

$$
\delta_{D}(\mathscr{E})+\frac{\alpha L D}{r}
$$

with respect to $D$.
Proof. (1). For simplicity, we put $\mathscr{F}=\mathscr{E}(-\delta(\mathscr{E}))$. By the standard computation we have

$$
\chi\left(S, \mathscr{S}^{t} \mathscr{F}\right)=\frac{1}{(r+1)!}\left\{-c_{2}(\mathscr{E})+\frac{r-1}{2 r} c_{1}^{2}(\mathscr{E})\right\}+O\left(t^{r}\right)
$$

Hence, by the Serre duality, we infer that $h^{0}\left(S, \mathscr{S}^{t} \mathscr{F}\right)$ or $h^{0}\left(S, \mathscr{S}^{t} \mathscr{F}^{*}+K_{S}\right)$ is

$$
\geq \frac{1}{4(r+1)!r}\left\{(r-1) c_{1}^{2}(\mathscr{E})-2 r c_{2}(\mathscr{E})\right\}+O\left(t^{r}\right) .
$$

Assume the first case and consider the following natural exact sequences

$$
\begin{aligned}
& 0 \rightarrow H^{0}\left(S, \mathscr{S}^{t} \mathscr{F}(-t \alpha L)\right) \rightarrow H^{0}\left(S, \mathscr{S}^{t} \mathscr{F}\right) \rightarrow H^{0}\left(C, \mathscr{S}^{t} \mathscr{F}\right), \\
& 0 \rightarrow H^{0}\left(C, \mathscr{S}^{t} \mathscr{F}(-t L)\right) \rightarrow H^{0}\left(C, \mathscr{S}^{t} \mathscr{F}\right) \rightarrow H^{0}\left(D, \mathscr{S}^{t} \mathscr{F}\right),
\end{aligned}
$$

where $C$ is a general curve linearly equavalent to $t \alpha L$ and $D$ is a 0 -cycle of degree $t^{2} \alpha L^{2}$. The first term of the second sequence vanishes as $\mathscr{F}(-t L)$ is negative. Hence $h^{0}\left(C, \mathscr{S}^{t} \mathscr{F}\right)$ is bounded by

$$
\begin{aligned}
t^{2} \alpha\left(\operatorname{rank} \mathscr{S}^{t} \mathscr{F}\right) L^{2} & \equiv \frac{\alpha t^{r+1}}{(r-1)!} L^{2} \\
& \equiv \frac{t^{r+1}}{6(r+1)!r}\left\{(r-1) c_{1}^{2}(\mathscr{E})-2 r c_{2}(\mathscr{E})\right\} \quad\left(\bmod O\left(t^{r}\right)\right) .
\end{aligned}
$$

This shows $H^{0}\left(S, \mathscr{S}^{t} \mathscr{F}(-t \alpha L)\right)$ is non-zero whenever $t$ is very large in view of the first exact sequence, and thus such a non-zero global section gives the inclusion $\mathscr{O}_{S}(t \alpha L) \hookrightarrow \mathscr{S}^{t} \mathscr{F}$. Similarly, the second case will yield $H^{0}\left(S, \mathscr{S}^{t} \mathscr{F}^{*}(-t \alpha L)\right) \neq 0$.
(2). It suffices to consider the following cases:
(a) If $\mathscr{S}^{t} \mathscr{F}$ contains $\mathscr{O}_{S}(t \alpha L)$, then

$$
\delta_{D}\left(\mathscr{E}_{1}^{D}\right)-\delta_{D}(\mathscr{E}) \geq \alpha L D
$$

(b) If $\mathscr{S}^{t} \mathscr{F}^{*}$ contains $\mathscr{O}_{S}(t \alpha L)$, then

$$
\delta_{D}\left(\mathscr{E}_{1}^{D}\right)-\delta_{D}(\mathscr{E}) \geq \frac{1}{r}\left\{\delta_{D}\left(\left(\mathscr{E}^{*}\right)_{1}^{D}\right)-\delta_{D}\left(\mathscr{E}^{*}\right)\right\} \geq \frac{\alpha L D}{r}
$$

This completes the proof.
Corollary 2.4.3. Let $\mathscr{E}$ be a torsion-free sheaf of rank $r$ on a normal projective variety $X$ of dimension $n$ and $H_{1}, \ldots, H_{n-2}$ be ample Cartier divisors. Let $D$ be a nef Cartier divisor on $X$. Assume that $H_{1} \ldots H_{n-2} D$ is not numerically trivial. If $\mathscr{E}$ is $\left(H_{1}, \ldots, H_{n-2}, D\right)$-semistable, then

$$
(r-1) c_{1}^{2}(\mathscr{E}) H_{1} \ldots H_{n-2} \leq 2 r c_{2}(\mathscr{E}) H_{1} \ldots H_{n-2} .
$$

Proof. Suppose the contrary. We may assume that $\mathscr{E}$ is a vector bundle in codimension 2 by taking double dual. Fix an ample divisor $H_{0}$ such that $\mathscr{E}\left(-\delta+H_{0}\right)$ and $\mathscr{E}^{*}\left(-\delta(\mathscr{E})+H_{0}\right)$ are both ample. Let $H$ be an arbitrary ample divisor. Then there exist positive integer $m_{1}, \ldots, m_{n-2}$ depending on $H$ such that $\left.H\right|_{S}$-semistable filtration of $\left.\mathscr{E}\right|_{S}$ coincides with the restriction of $\left(H_{1}, \ldots, H_{n-2}, H\right)$-semistable filtration of $\mathscr{E}$ to a generic complete intersection surface $S=\left(m_{1} H_{1}\right) \ldots\left(m_{n-2} H_{n-2}\right)$.

By Corollary 2.4.3, we have

$$
\begin{aligned}
\delta\left(\mathscr{E}_{1}^{(\mathscr{B}, H)}\right) S H-\delta\left(\mathscr{E}^{\mathscr{B}, H)}\right) S H & =\delta_{H}\left(\left(\left.\mathscr{E}\right|_{S}\right)_{1}^{H}\right)-\delta_{H}\left(\left(\left.\mathscr{E}\right|_{S}\right)^{H}\right) \\
& \geq c\left\{(r-1) c_{1}^{2}\left(\left.\mathscr{E}\right|_{S}\right)-2 r c_{2}\left(\left.\mathscr{E}\right|_{S}\right)\right\}\left(H, H_{0}\right)_{S} /\left(H_{0}^{2}\right)_{S} \\
& =c\left\{(r-1) c_{1}^{2}(\mathscr{E})-2 r c_{2}(\mathscr{E})\right\} H H_{0} S / H_{0}^{2} S,
\end{aligned}
$$

where $\mathfrak{B}=\left(H_{1}, \ldots, H_{n-2}\right)$ and $c$ is a constant. Therefore, by dividing out both sides by $m_{1} \ldots m_{n-2}$, we obtain the inequality

$$
\delta_{(\mathfrak{B}, H)}\left(\mathscr{E}_{1}^{(\mathfrak{B}, H)}\right) \geq \delta_{(\mathfrak{B}, H)}(\mathscr{E})+c H H_{0} H_{1} \ldots H_{n-2}
$$

By the continuity of the function $\delta_{\mathfrak{A}}\left(\mathscr{E}_{1}^{\mathfrak{A}}\right)$ on a segment joining $(\mathfrak{B}, D)$ and ( $\mathfrak{B}, H$ ), we have

$$
\delta_{(\mathfrak{B}, D)}\left(\mathscr{E}_{1}^{(\mathfrak{B}, D)}\right) \geq \delta_{(\mathfrak{B}, H)}(\mathscr{E})+c D H_{0} H_{1} \ldots H_{n-2}>\delta_{(\mathfrak{B}, D)}(\mathscr{E}),
$$

a contradiction.
Corollary 2.4.4. Let $\mathscr{E}$ be a torsion-free sheaf of rank $r$ on a normal projective variety $X$ of dimension $n$ and $H_{1}, \ldots, H_{n-2}$ be ample Cartier divisors. If

$$
\left\{(r-1) c_{1}^{2}(\mathscr{E})-2 r c_{2}(\mathscr{E})\right\} H_{1} \ldots H_{n-2}>0,
$$

then $\mathscr{E}$ is $\left(H_{1}, \ldots, H_{n-2}, D\right)$-unstable for any non-zero nef divisor $D$.

### 2.5. Semistability in positive and mixed characteristic.

2.5.1. Semistability in positive characteristic. Let $C$ be a smooth complete curve over an algebraically closed field $k$ of characteristic $p>0$.

Definition 2.5.1. A vector bundle $\mathscr{E}$ on $C$ is said to be strongly semistable if, for every positive integer $s,\left(F^{s}\right)^{*} \mathscr{E}$ is semistable.

Remark 2.5.1. If $C$ is an elliptic curve, it's known that every semistable bundle is strongly semistable, but that is not the case when $g(C) \geq 2$.
Proposition 2.5.1. If $\mathscr{E}$ is strongly semistable on $C$, then $f^{*} \mathscr{E}$ is semistable for any surjective $k$-morphism $f: C^{\prime} \rightarrow C$.

Proof. Let $C^{\prime \prime}$ be a smooth model of the seperable closure of $C$. The natural projection $C^{\prime} \rightarrow C^{\prime \prime}$ is pure inseparable and hence $C^{\prime}=F^{-s} C^{\prime \prime}$ for some non-negative integer $s$ (Proposition IV 2.5 of [Har77]). Thus we get the commutative diagram

Since $\mathscr{E}$ is strongly semistable, we have $\left(F^{s}\right)^{*}$ is semistable on $F^{-s} C$, and thus $f^{*} \mathscr{E}=g^{*}\left(F^{s}\right)^{*} \mathscr{E}$ is also semistable by Lemma 2.2.1 as $g$ is seperable.

Remark 2.5.2. The Theorem 2.2.1 and its corollaries still hold in positive characteristic if the "semistability" is subsituted by "strong semistability".
2.5.2. Semistability in mixed characteristic. Let $X$ be a smooth projective variety over a noetherian integral domain $R$ of characteristic zero and $\mathscr{E}$ be a torsion-free sheaf on $X$. Fix $\mathfrak{A} \in \overline{\mathrm{NA}}(X / R)_{\mathbb{Q}}^{n-1}$, where $n$ is the relative dimension of $X$. Then the set of geometric points $t \in \operatorname{Spec} R$ such that $\mathscr{E}_{t} / X_{t}$ is $\mathfrak{A}$-semistable forms an open subset.

On the contrary, we know very little about the strong semistability of the reductions of a semistable sheaves.
Question 2.5.1. Let $C$ be an irreducible smooth projective curve over a noetherian integral domain $R$ of characteristic zero. Assume that a locally free sheaf $\mathscr{E}$ on $C$ is $\mathfrak{A}$-semistable on the generic fibre $C_{*}$. Let $S$ be the set of primes of positive characteristic on $\operatorname{Spec} R$ such that $\mathscr{E}$ is strongly semistable. Is $S$ a dense subset of $\operatorname{Spec} R$ ?
2.6. Generic semipositive theorem for cotangent bundle. From now on, all varieties are defined over an algebraically closed field $k$ of characteristic 0 . Let $X$ be a normal projective variety of dimension $n$.
Definition 2.6.1. Let $\mathfrak{B} \in \overline{\mathrm{NA}}(X)_{\mathbb{Q}}^{n-2}$.
(1) A torsion-free sheaf $\mathscr{E}$ on $X$ is said to be generically $\mathfrak{B}$-seminegative if, for every numerically effective $\mathbb{Q}$-Cartier divisor $D$ on $X$, its maximal $(\mathfrak{B}, D)$-destabilizing subsheaf $\mathscr{E}_{1}$ satisfies $\delta_{(\mathfrak{B}, D)}\left(\mathscr{E}_{1}\right)<0$.
(2) A torsion-free sheaf $\mathscr{E}$ on $X$ is said to be generically $\mathfrak{B}$-semipositive if $\mathscr{E}^{*}$ is generically $\mathfrak{B}$-seminegative.

Lemma 2.6.1. Let $\mathscr{E}$ be a torsion-free sheaf on $X$ and

$$
0=\mathscr{E}_{0} \subseteq \mathscr{E}_{1} \subset \cdots \subset \mathscr{E}_{s}=\mathscr{E}
$$

be the $(\mathfrak{B}, D)$-semistable filtration of $\mathscr{E}$ and put $\alpha_{i}=\delta_{(\mathfrak{B}, D)}\left(\mathscr{E}_{i} / \mathscr{E}_{i-1}\right)$. Then $\alpha_{1}>\cdots>\alpha_{s} \geq 0$ for every $D \in \overline{\mathrm{NA}}(X)_{\mathbb{Q}}$ if $\mathscr{E}$ is generically $\mathfrak{B}$-semipositive.
Proof. It follows from the definition.
Theorem 2.6.1. Let $\mathfrak{B}=\left(H_{1}, \ldots, H_{n-2}\right) \in \mathrm{NA}(X)_{\mathbb{Q}}^{n-2}$ and $\mathscr{E}$ be a generically $\mathfrak{B}$-semipositive torsion-free sheaf on $X$. Then

$$
c_{2}(\mathscr{E}) H_{1} \ldots H_{n-2} \geq 0
$$

holds.

Theorem 2.6.2. Let $\mathfrak{B}=\left(H_{1}, \ldots, H_{n-2}\right) \in \mathrm{NA}(X)_{\mathbb{Q}}^{n-2}$. Then the torsionfree sheaf $\rho_{*} \Omega_{X^{\prime}}^{1}$ is generically $\mathfrak{B}$-semipositive unless $X$ is uniruled, where $\rho: X^{\prime} \rightarrow X$ denotes an arbitrary resolution.

## 3. Results

### 3.1. Semipositivity of $3 c_{2}-c_{1}^{2}$.

Proposition 3.1.1. Let $X$ be a non-uniruled, normal projective variety of dimension $n$ with $\mathbb{Q}$-Cartier canonical divisor $K_{X}$ which is nef. Let $\mathfrak{B} \in$ $\mathrm{NA}(X)_{\mathbb{Q}}^{n-2}$ such that $K_{X}^{2}|\mathfrak{B}|$ is positive. Then

$$
\left\{3 c_{2}(\mathscr{E})-c_{1}(\mathscr{E})^{2}\right\}|\mathfrak{B}| \geq 0,
$$

where $\mathscr{E}=\rho_{*} \Omega_{X^{\prime}}^{1}$ and $\rho: X^{\prime} \rightarrow X$ is an arbitrary resolution.

### 3.2. Non-negativity of the Kodaira dimension of minimal threefolds.

### 3.2.1. The Gorenstein case.

Theorem 3.2.1. Let $X$ be a normal projective Gorenstein threefold with only canonical singularities ( $X$ is Gorenstein if and only if $K_{X}$ is a Cartier divisor). Assume $K_{X}$ is nef. Then the Euler characteristic $\chi\left(X, \mathscr{O}_{X}\right)$ is nonnegative. In particular, either $h^{0}\left(X, \mathscr{O}_{X}\left(K_{X}\right)\right)$ or $h^{1}\left(X, \mathscr{O}_{X}\right)$ is non-zero, and thus $\kappa(X) \geq 0$.
3.2.2. The $K_{X}^{2}$ is numerically non-trivial case.

Theorem 3.2.2. Let $X$ be a normal projective Gorenstein threefold with only isolated singularities. Assume the $\mathbb{Q}$-Cartier divisor $K_{X}$ is nef and $K_{X}^{2}$ is numerically non-trivial. Then $\kappa(X) \geq 0$.
